

Fourstop: disposable super-absorbent non-slip mat designed for liquid absorption in hospital settings.

It is a solution for absorbing liquids in **operating rooms**, near **surgical sinks**, in **sterilisation stations** and, in general, in all places where fluids can wet the floor.

In operating rooms **it allows large quantities of fluids to be quickly absorbed and retained** and is therefore particularly suitable for surgical procedures where there is an plentiful spillage of liquids which, falling to the floor, could cause healthcare workers to slip and fall.

Thanks to its **very reduced thickness**, it allows trolleys to pass easily and facilitates the movement of the surgical staff within the room.

The use of Fourstop also helps **to reduce cleaning and recovery time between operations**, thus improving patient turnaround times and increasing the number of surgical procedures during the day.

The **top layer** of Fourstop is composed of a **transparent three-dimensional perforated film with funnel-shaped cones**, which allows **fast and capillary absorption and prevents the reflux of liquids** that are retained by the inner cellulose layer.

The **waterproof, non-slip bottom layer anchors the mat to the floor and holds it in place** without the use of adhesives that could leave sticky traces on the floor.
